Google searches involving black-sounding names are more likely to serve up ads suggestive of a criminal record than white-sounding names, says computer scientist

Ad related to latanya sweeney ⓘ

Many people will have experience Googling friends, colleagues and relatives to find out about their online presence – the websites on which they appear, their pictures, hobbies and so on.

Sweeney's interest is in the ads that appear alongside these results. When she entered her name in Google an ad appeared with the wording:

"Latanya Sweeney, Arrested? 1) Enter name and state 2) Access full background. Checks instantly. www.instantcheckmate.com"

This is suggestive wording. It suggests that Latanya Sweeney has a criminal record the details of which can be accessed by clicking on the ad. But after hitting the link and paying the necessary subscription fee, Sweeney says she found no record of arrest.

What's interesting about this is that Sweeney's first name is also suggestive—that she is black. The question Sweeney asks is whether a similar search with a name suggestive of a white racial profile also serves up ads mentioning arrest records.

"Have you ever been arrested? Imagine the question not appearing in the solitude of your thoughts as you read this paper, but appearing explicitly whenever someone queries your name in a search engine."

So begins Latanya Sweeney at Harvard University in a compelling paper arguing that racial discrimination plagues online ad delivery.

"Black-sounding" names 25% more likely to be served ad suggesting criminal record

Ethics

We have to accept that Machine Learning can seem creepy, how do we prevent it from becoming immoral?

We have an **ethical obligation** on to not teach machines to be prejudiced

Organizadores:

Women Who Code, Alaina Percival, Barbara

Mission:

Women Who Code is a global nonprofit organization dedicated to inspiring women to excel in technology careers by creating a global, connected community of women in technology. The organization tripled in 2013 and has grown to be one of the largest communities of women engineers in the world.

Empowerment:

Women Who code is a professional community for women in tech. We provide an avenue for women to pursue a career in technology, help them gain new skills and hone existing skills for professional advancement, and foster environments where networking and mentorship are valued.

Key Initiatives:

Free technical study groups

Events featuring influential tech industry experts and investors

Hack events

Career and leadership development

Current and aspiring coders are welcome.

Bring your laptop and a friend!

Women less likely to be shown ads for high-paid jobs on Google, study shows

Automated testing and analysis of company's advertising system reveals male job seekers are shown far more adverts for high-paying executive jobs

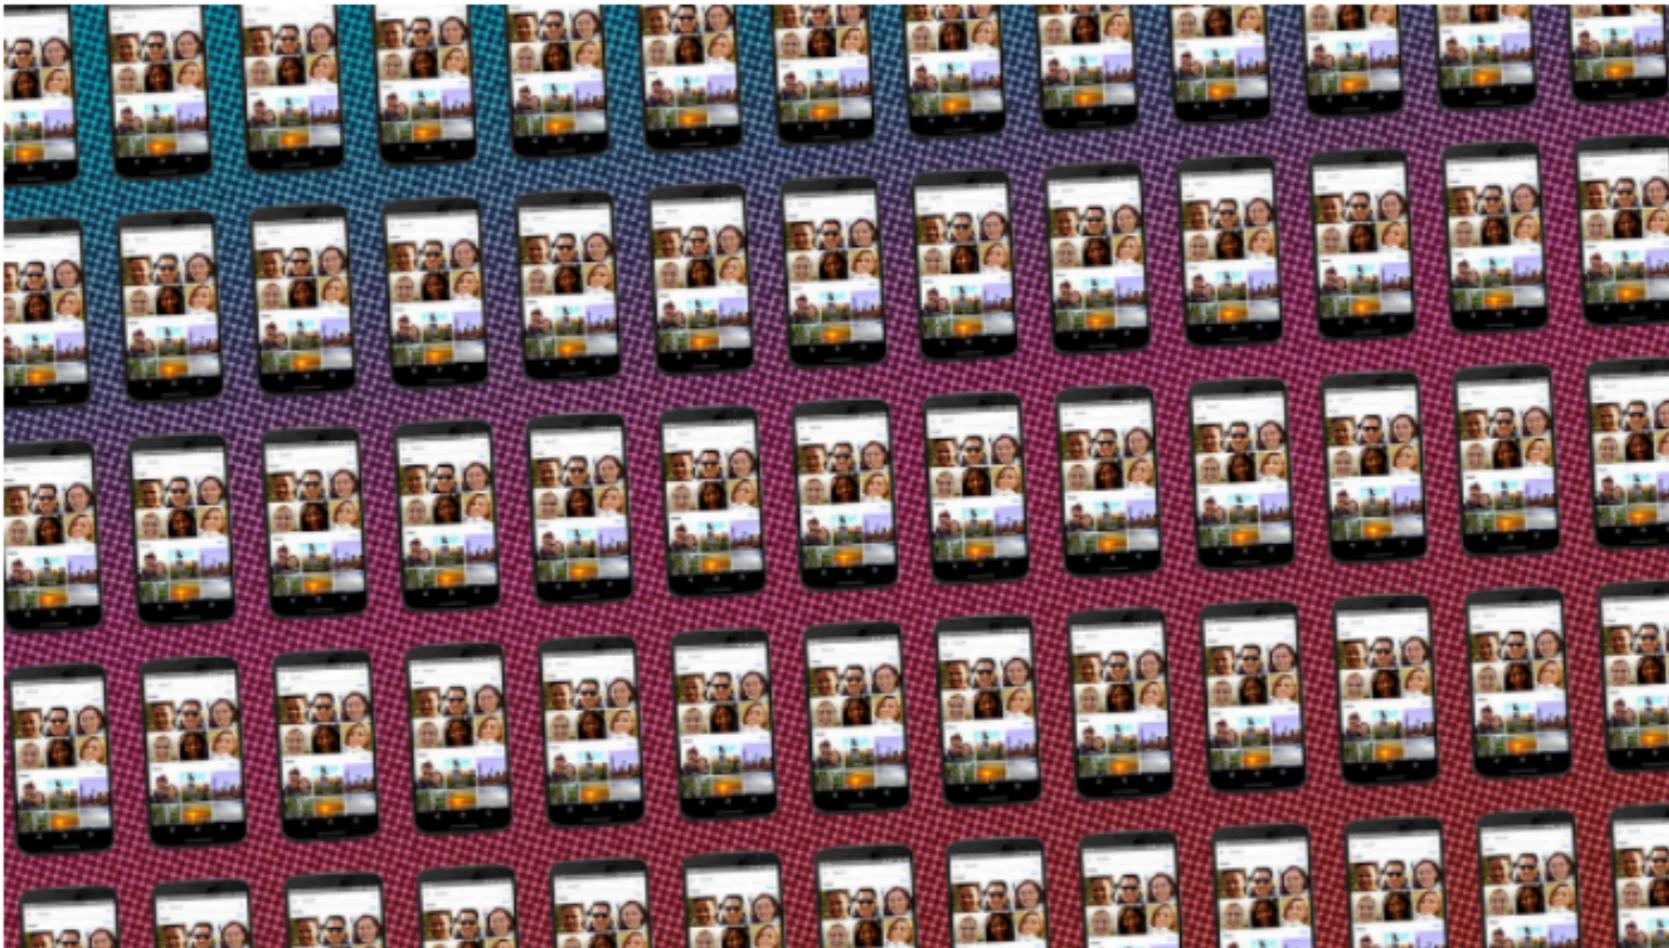

▲ One experiment showed that Google displayed adverts for a career coaching service for executive jobs 1,852 times to the male group and only 318 times to the female group. Photograph: Alamy

Female job seekers are much less likely to be shown adverts on [Google](#) for highly paid jobs than men, researchers have found.

The team of researchers from Carnegie Mellon built an automated testing rig called AdFisher that pretended to be a series of male and female job seekers. Their 17,370 fake profiles only visited jobseeker sites and were shown 600,000 adverts which the team tracked and analysed.

"Holy F**K": When Facial Recognition Algorithms Go Wrong

[SCREENSHOT: VIA GOOGLE PHOTOS]

Google's new [Photos](#) service, which uses machine learning to automatically tag photos, made a huge miscalculation on Monday when it automatically tagged two African-Americans as "gorillas." Developers at Google immediately apologized for the gaffe and then worked to fix the app's database.

Can machine learning help us find – and reduce – gender bias? Doctor/nurse via shutterstock.com

Removing gender bias from algorithms

We can test how well the word relationships are identified by using analogy puzzles. Suppose I ask the system to complete the analogy “**He is to King as She is to X.**” If the system comes back with “Queen,” then we would say it is successful, because it returns the same answer a human would.

Man is to Computer Programmer as Woman is to Homemaker? Debiasing Word Embeddings

Tolga Bolukbasi¹, Kai-Wei Chang², James Zou², Venkatesh Saligrama^{1,2}, Adam Kalai²

tolgab@bu.edu, kw@kwchang.net, jamesyzou@gmail.com, srv@bu.edu, adam.kalai@microsoft.com

Our research group trained the system on Google News articles, and then asked it to complete a different analogy: “Man is to Computer Programmer as Woman is to X.” The answer came back: “**Homemaker.**”
